

Movies Data Analysis and Rating Insights

Here is where your presentation begins

Introduction

Cinema plays a significant role in global entertainment and culture.

Understanding what makes a movie successful helps filmmakers, producers, and digital platforms enhance audience satisfaction. This project analyzes data from the top rated movies on IMDb to explore trends and influential factors related to movie success.

Problem Statement

Let's have a look

There is limited clarity regarding the key attributes that influence the overall rating of a movie , The lack of structured analysis makes it difficult to predict movie success or identify patterns that characterize top Rated films.

02

OBJECTIVES OF THE PROJECT

Let's have a look

1. Analyze and visualize important characteristics of top IMDb movies
2. Investigate the relationship between movie attributes such as year, duration, and number of votes with rating.
3. Gain insights into audience preferences and genre trends.
4. Build a simple predictive model to estimate movie rating based on selected features.

Let's have a look

Previous studies have focused on analyzing movie performance using publicly available datasets from IMDb. Most works highlight the role of factors such as budget, genre, and audience engagement in rating prediction. This project follows a similar approach, focusing on data exploration and simple machine learning modeling without deep learning techniques.

A decorative graphic consisting of a 6x4 grid of dots in the top-left corner. The dots are arranged in four columns: the first three columns have six dots each, and the fourth column has five dots. The dots are in two shades of gray.
